

HOW TO KEEP COOL WHILE BOONDOCKING

Another Success Story for SoftStartUp

PROBLEM: THOMAS AND VICTORIA HAVE TROUBLE WITH TRIPPING BREAKERS WHILE BOONDOCKING

Boondocking offers incredible opportunities to explore remote areas, but it comes with its own set of challenges for Thomas and Victoria, especially when it comes to power management. During their recent adventures, they faced significant issues with our generator's ability to handle the power draw from our RV's air conditioning unit.

SOLUTION: THE SOFTSTARTUP MAXIMIZES POWER WHEN DEVICES START-UP

The SoftStartUp reduces the power draw of appliances, particularly those with high startup demands like air conditioners and microwaves so you can run devices on low power.

There was **no installation**, and no electrical expertise required, allowing Thomas and Victoria to plug it in and start feeling comfortable straight away.

The **freed up power** allowed Thomas and Victoria to run their microwave, blender, small heaters, and portable A/Cs.

RESULT: THE SOFTSTARTUP RUNS THE A/C SMOOTHLY WHILE BOONDOCKING

After setting up the SoftStartUp, Thomas and Victoria fired up their generator and plugged in the RV.

The air conditioning unit started with ease. Even when they pushed ran the microwave and coffee-making equipment, the generator held strong without tripping.

Over the next few days at Pothole State Park, they put the Soft Start to the test, restarting it multiple times without any issues. It proved **invaluable in helping them maintain a comfortable environment while camping off-grid.** "I really feel like this thing's going to help us with our off-grid camping experiences," said Thomas
