

OVERCOMING RV POWER CHALLENGES WITH THE SOFTSTARTUP

Another Success Story for SoftStartUp

THE PROBLEM: POWERING AN RV AIR CONDITIONER OFF-GRID

Traveling across the country in an RV provides a sense of freedom, but it also comes with its fair share of challenges. Fellow RV owner, Lee, ran into power management issues with his generator as it only had standard house wall plugs rather than the necessary 30-amp plug. Without a reliable way to start his A/C on generator power, Lee and his wife were forced to rely on RV parks with full electrical hookups, limiting their flexibility while traveling.

THE SOLUTION: SOFTSTARTUP TECHNOLOGY

Determined to find a better solution, Lee decided to try a SoftStartUp. This device **allows RV air conditioners to start up with lower power demand**, making it possible to run them on smaller generators **without tripping breakers**.

The SoftStartUp is **ideal for boondocking and off-grid camping**.

Lee appreciated that this product eliminated the need for extensive rewiring or roof installation, making it a viable option for someone with limited mobility after knee surgery.

THE RESULT: ENHANCED FLEXIBILITY AND FREEDOM

With the SoftStartUp installed, Lee gained more travel flexibility. Instead of being restricted to RV parks and locations with full hookups, **he could now consider staying at places that often lack high voltage power pedestals**.

He also found that the unit performed well in various travel conditions, including hot and humid environments where air conditioning is a necessity.

The ability to take it along and use it with future RV setups added to its overall value. With his newfound confidence in off-grid air conditioning, **he is better prepared for future travels, ensuring a more comfortable experience for both himself and his wife**.
